QA Tasks and System Exploration

For today's tasks, I was initially assigned to test two projects: BHND THE WORK and Sarah Digitals. However, both projects are not yet in the staging phase, which limited the available testing activities.

To remain productive, I revisited the Socia Landing Page project and conducted another round of observation. During this review, I identified a visibility issue with the Socia logo on the browser title bar when viewed in light mode on certain browsers. I immediately reported this observation to Sir Wahid, who instructed me to file a ticket for the issue.

Afterward, upon asking for additional tasks, Sir Wahid allowed me to explore the APC system. I began by using the system from a regular user's perspective, then proceeded to inspect each component of the interface more thoroughly. I identified several potential issues; however, instead of ticketing them immediately, I documented my observations first. This was done intentionally, as I was informed that many features are still under development, and I wanted to avoid raising premature or invalid tickets.

Once I compiled my observations, I cross-checked them against existing tickets and filtered out issues that had already been reported. I then consulted Sir Wahid to confirm whether the remaining observations were valid and reasonable to ticket. After review, he confirmed that the identified issues were appropriate, and I was advised to proceed with ticket creation the following day.
